New mutant glucose isomerase enzymes -

Obtd. by site-directed mutagensis of gene from Actinoplanes

obtd. by site-directed mutagensis of gene from Actinoplanes

Example, Floure 19, 56pp; English.

The invention is a novel mutant glucose isomerase (GI) enzyme with

Improved properties thru As substitu. The GI is pref. derived from

Actinoplanes missouriensis. The substitu. is Lys for Arg.

Or vice versa. Specific Lys or Arg residues are identified and site-

directed mutagenesis of the DNA sequence encoding the GI is performed.

The novel mutant gi shows 55 per cent or more sequence homology with the

As sequence of WT A. missouriensis GI. Compared to wr enzyme it shows

Chipher conversion performance and improved thermostability and pH

stability. The example concerns the cloning and sequencing of

GI from other bacterial strains. Fig 21 displays the AA SOS to

Example 1; Fig 3; 7pp; Japanese.

This DNA encodes a Streptomyces glucose isomerase. This glucose isomerase is used to create a mutant with improved heat resistance which comprises replacing an amino acid in a specific position of t isomerised sugar.

Sequence. The glucose isomerase is useful for the preparation of Sequence 1164 Bp; 181 A: 263 atgaactaccagcccaccccgaggacaggttcaccttcggcctgtggaccgtcggctgg caggggcgggaccccttcggcgacgccacgcgtcccgccttcgacccggtcga---cgtg ttoggggggtccgacaccgagggggggggaggtcaaggggttcgtcagggggttcgac gagggcgcgcggtgccgccaaggacgtgcgtgcggccctggaccgcatgaaggag gagocomagocogamogagocogogogogacatectgotocomecategocomecogococo gccttcatcgagcgcctggagcgccccgagctgtacggtgtcaaccccgaggtgggccac cagoggotggcogaactgggcgcotacggagtgacottccacgacgacgactgatccc TTCGGGTCGTCCGACACCGAGCGCGAGTCGCACATCAAGCGGTTCCGCCAGGCCCTGGAC . 6 61.2%; Score 946.2; DB 1; Length 1164; 90.0%; Pred. New in the patent are muteins of the protein encoded by n91083. These muteins are used to convert glucose to fructose, and xylose to xylulose, eg in mfr. of sweeteners. Compared with native xylose the muteins have different chemical and thermal stability, kinetic constants, specificity and/or lower optimum PH. Amino acid substitution sites are selected by first determining, from the crystallographic structure, the phi and psi angles, then screening these for values within the specified ranges eg a site which has a phi backbone configuration angle -40 to -90 degrees when psi configuration angle is 0 to -60 degrees, ven psi configuration angle is 0 to -60 degrees.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Fig. 2012/19.705.

Bloogically active modified protein prodn. -
comprises substituting arganine residue for lysine in starting protein
; Fig 16, 64pp; English.
Its starting protein is native D-glucose isomerase. It is a portion of
vectors pMa5-GI and pMc5-GI used in the process of making a modified
D-glucose isomerase gene. The method involves substituting one or more
Lys with Arg, or vice versa, at a site which can accommodate such a
substitution without altering the biological activity. The resulting
gene has enhanced thermostability and increased resistance towards
chemical modification

Comprises substituting arganine residue for lysine in starting protein
Fig 15; 64pp; English.
It encodes D-glucose lasomerase from Actinoplanes missouriensis
(DSM 43046). It is genetically engineered to code for a mutein
that has increased thermostability and increased resistance
towards chemical modification. It is used in an example of
the method, which is claimed, where one or more Lys are substd. by Arg o.
vice verse, at a site which can accommodate such a substitution without
altering the biological activity. Lysine-253 was substd. by Arg.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New mutant glucose isomerase enzymes -
obtd. by site-directed mutagensis of gene from Actinoplanes
missouriensis, used for prodn. of high fructose corn syrups
missouriensis, used for prodn. of high fructose corn syrups
missouriensis, used for prodn. of high fructose corn syrups
missouriensis, novel mutant glucose isomerase (GI) enzyme with
improved properties thru AA substitn. The GI is pref. derived from
Actinoplanes missouriensis. The substitn. is Lys for Arg.
or vice versa. Specific Lys or Arg residues are identified and site-
directed mutant gi shows 65 per cent or more sequence homology with tl
AA sequence of WT A. missouriensis GI. Compared to wt enzyme it shows
higher conversion performance and improved thermostability and pH
stability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Complete gene sequence of wildtype (WT) Actinoplanes missouriensis glucose isomerase (GI)

Trocked in - expressed on large scale and used to produce conc.

fructose from glucose

fructose from glucose

Claim 1; Frg 1-3; 24pp; English.

To obtain the DNA sequence of the xylose isomerase gene from Thermus aquaticus genomic DNA from T. aquaticus was digested by SacI and the gel neutralised. The DNA was denatured and the gel neutralised The DNA fragments were blotted onto a nylon membrane and hybridised with a labelied 287 base Bgl fragment of a Streptomyces griseofuscus 5-41 xylose isomerase gene. A single digested with SacI. This was used to transform E. Coli JM109 and transformants selected using the above probe. A 1.8 kb SacI transformants selected using the above probe. A 1.8 kb SacI cransformants and subcloned into E. Coli JM109 using pUC118 and pUC119. These fragments were then sequenced. The gene allows large scale expression of T. aquaticus xylose isomerase which is used in the prob. Of fructose at higher temperatures than those previously problem. Colouries and highly conc. fructose which is free of coloured by prods. Such as psicose, usually formed when the pH of the reaction mixtures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              445
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           382
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           269 taccagcccaccccgaggacaggttcaccttcggcctgtggaccgtcggctggcaggg 328

The specification describes antisense oligonucleotides (X52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and
con-coding regions of RNAs corresponding to target genes, coding and
con-coding regions of RNAs corresponding to target genes, coding
initiation codons, genomic flanking regions, intron-exon borders, the
confidence of the 3'-end and the juxta-section between coding and non-coding
confidence and all segments of RNAs encoding proteins associated with one
cor more diseases, conditions or mixtures. The antisense oligonucleotides (specifically X55180-271) can be used for the antisense
creatment of diseases and conditions. Typical diseases and conditions
creatment of diseases and conditions. Typical diseases and conditions
are those associated with impaired respiration and inflammation,
allergic rhinitis, acute asthma, allergies, asthma, impeded respiration,
crespiratory distress syndrome, pain, cystic fibrosis, pulmonary
pulmonary diseases (COPD), and cancers wich as leukemias, lymphomas,
cancer, hepatocellular carcinoma, kidney cancer, melanoma, hepatic
cancer, hepatocellular carcinoma, kidney cancer, melanoma, hepatic
metastasized to the lungs, including breast and prostate cancer.

Protease Tap-negative cells were transformed with a S. lividans 66 genomic library and screened with APA-beta-naphthylamide to isolate colonies contg. genes (099365-68) for novel proteases P5-4, P5-6, P5-10 and P8-2 (R80505-08). Impaired expression of such proteases by Streptomyces hosts improves the quality, quantity and stability of excygenous gene products. 602 G; 221 T; Sequence 1821 BP; 238 A; 715 C; 602 G; 221 T;

Bxample 25; Fig 25A-C; 83pp; English.

Example 25; Fig 25A-C; 83pp; English.

The present sequence encodes an aminopeptidase designated SlpD. The specification also describes a tripeptidyl aminopeptidase (TAP) of Streptomyces. The aminopeptidase is endogenous to Streptomyces and cleaves an N-terminal sequence of X-pro-Y, where X is an alibhatic or hydroxy amino acid and Y is an aliphatic, hydroxy or sulphur-containing amino acid. The TAP of Streptomyces are useful in the production of proteins, such as GM-CSF, interleukin-3 (IL-3), Sequence 1821 BP; 283 A; 715 C; 602 G; 221 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     543 geracecesecaagerecececearaceaearecagesecereaecececeses

recombinant francisin antibiotics

clust 1: Page 40-60; 66pp; English

This DNA sequence comprises the Streptomyces franciscin gene

cluster containing specifically claimed coding sequences (genes

A-U) that respecitively encode 21 proteins (see W34199-219) involved

in franciscin synthesis. The genes can be divided into 5

subclusters: (1) genes A, B, C, D and F encode an efflux pump; (2)

subclusters: (1) genes A, B, C, D and F encode an efflux pump; (2)

subclusters: (1) genes A, B, C, D and F encode an efflux pump; (2)

subclusters: (3) genes A, B, C, D and F encode an efflux pump; (2)

The present sequence represents a frenolicin gene cluster from Streptomycas roseofulus. The present intention describes: (1) a cettor containing the frenolicin gene cluster DNA sequence operably connected to an expression control sequence; (2) a host cell remoistered by the above vector; (3) a protein coded by the above DNA cransformed by the above vector; (3) a protein coded by the above DNA composition or transformed for the preparation of frenolicin or a biosynthetic intermediate for it in which the above cell is cultured and frenolicin or its biosynthetic intermediate is isolated from the culture or the cell; (5) a method for the preparation of frenolicin B coulture or the cell; (5) a method for the preparation of frenolicin B composition by mixing frenolicin with other components.

Creamolicin B is useful as an antibiotic: (8499 G; 3011 T;

DNA encoding Streptomyces ambofaciens platenolide synthase domain - production of spiramycin-related polyketide antibiotics production of spiramycin-related polyketide antibiotics claim 9; Pages 8-33; 81pp; English.

This sequence represents the platenolide synthase gene cluster of the invention. This sequence encodes the related from Streptomyces ambofaciens. This sequence encodes the multi-functional proteins which direct the synthesis of the polyketide platenolide. Platenolide is the basic building block of the macrolide antibiotic spiramycin. The DNA can be used to produce compounds exhibiting antibiotic activity based on the platenolide structure, concluding specifically the macrolide antibiotic spiramycin analogues and derivetives. Modifications of the platenolide synthase DNA sequence can be made so as to change the number and type of carboxylic alide incorporated into the growing polyketide chaim and to change the kind of post-condensation processing that is conducted.

production of tylosin-related polyketide compounds

Transpired by Azaron Faratives fradiae tylactone synthase domain - for
production of tylosin-related polyketide compounds
Example 2; Pages 10-134; 220pp; English.

This sequence represents the platenolide synthase gene cluster of the invention. This sequence is referred to as the srmG gene, and was invention. This sequence encodes the multi-functional proteins which direct the synthesis of the polyketide platenolide. Platenolide is the basic building block of the macrolide antibiotic spiramycin. This sequence was used along with the tylG gene antibiotic spiramycin. This sequence was used along with the tylG gene is the tylactone synthase gene cluster of the invention. The tylG gene is the tylactone synthase gene cluster of the invention. The tylG gene sequence was isolated from Streptomyces fradiae, and encodes multifunctional proteins which direct the synthesis of the polyketide tylactone. Tylactone is the basic building block of the antibiotic tylactone. Tylactone can be used to transform S. ambofaciens con tacking the srmG ORF1 sequence, or S. fradiae lacking the tylG ORF1
